

A tutorial for adding custom png sprites to your project!

If you have Adobe Photoshop, the Photoshop file contains a psd template.

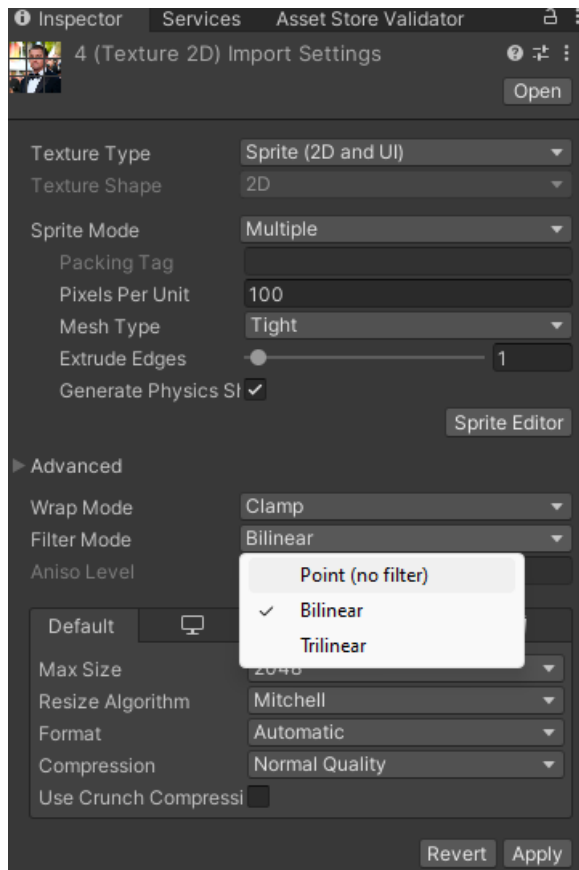

Or you can cut and place it yourself.

If the image fragments are in 1 png sprite, you can split them using these ways!

1.Sprite mode: “Multiple”

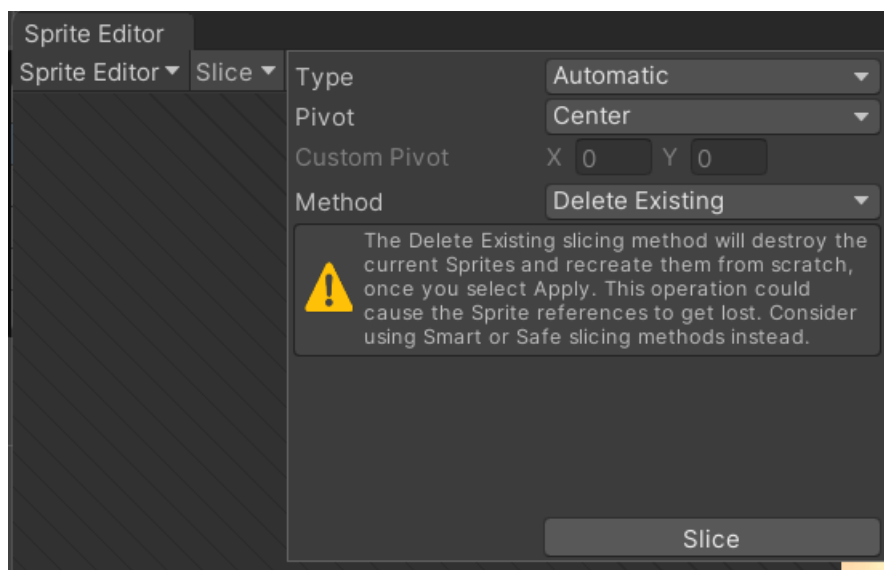

Filter mode: Point (no filter)

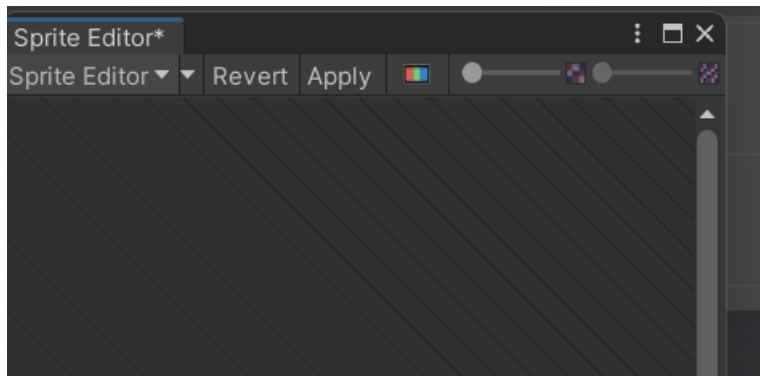

After changing these two things, click the "[apply](#)" button.

Then you need to enter the "Sprite Editor".

"Slice" at the top right => (don't touch anything) Slice => Apply!

If you have done this correctly, you can place your image in the "Explorer" object.

If there is an error or you have a question, you can write to the following email: kz.ibeta.games@gmail.com
